

ABSTRACT

A method and apparatus for measuring signals conveyed by a varying the
5 voltage polarity across the tip and ring terminals in a telephone system is disclosed.
The invention provides a composite circuit including a first stage in the form of a
differential amplifier, a second stage in the form of a low pass filter, and a third stage in
the form of a Schmidt trigger. The invention is capable of discerning an intentional
polarity reversal telephony signal by eliminating transmission noise, as well as false
10 triggering due to a high frequency (relative to a defined threshold) ring signal.
